

ORBSCAN

Corneal Imaging

M.Nejabat

Shiraz University of medical sciences

Topographic technologies

- Placido disk –based topography
- AstraMax : (three-dimensional topography)
- Elevation-based topography:
 - Slit-scanning topography (orbscan)
 - Scheimpflug imaging (Pentacam-Galilei-Precisio)
- Artemis : (ultrasound digital topography)

Elevation based topography

Orbscan:

- **Placido disc & slit scanning**

Pentacam:

- Scheimpflug imaging

Galilei :

- Dual scheimpflug imaging & placido disc

Precisio:

- Scheimpflug imaging

Orbscan IIz

Orbscan IIz

- Placido disk - 40 rings
- Slit scanning system
 - 20 R , 20 L : 40 scans
 - 0.7 seconds
 - 45 degree angle
- 240 points measure per slit : 9600 points totally
- Tracking system measure eye movement

Reflective and Slit-scan Technologies

- One image, one surface
- Angle-dependent specular reflection
- Measures slope (as a function of distance)

- Multiple images, multiple surfaces
- Omni-direction diffuse backscatter
- Triangulates elevation

ORBSCAN is Multidimensional

Integrates multiple disparate technologies:
slit-scan, reflective, ultrasound

Measures multiple ocular surfaces:
anterior cornea, posterior cornea, anterior iris, anterior lens

Displays multiple and complete mathematical surfaces:
curvature, power, elevation, thickness

Multidimensionality makes Orbscan powerful
The wide variety of maps can make Orbscan bewildering

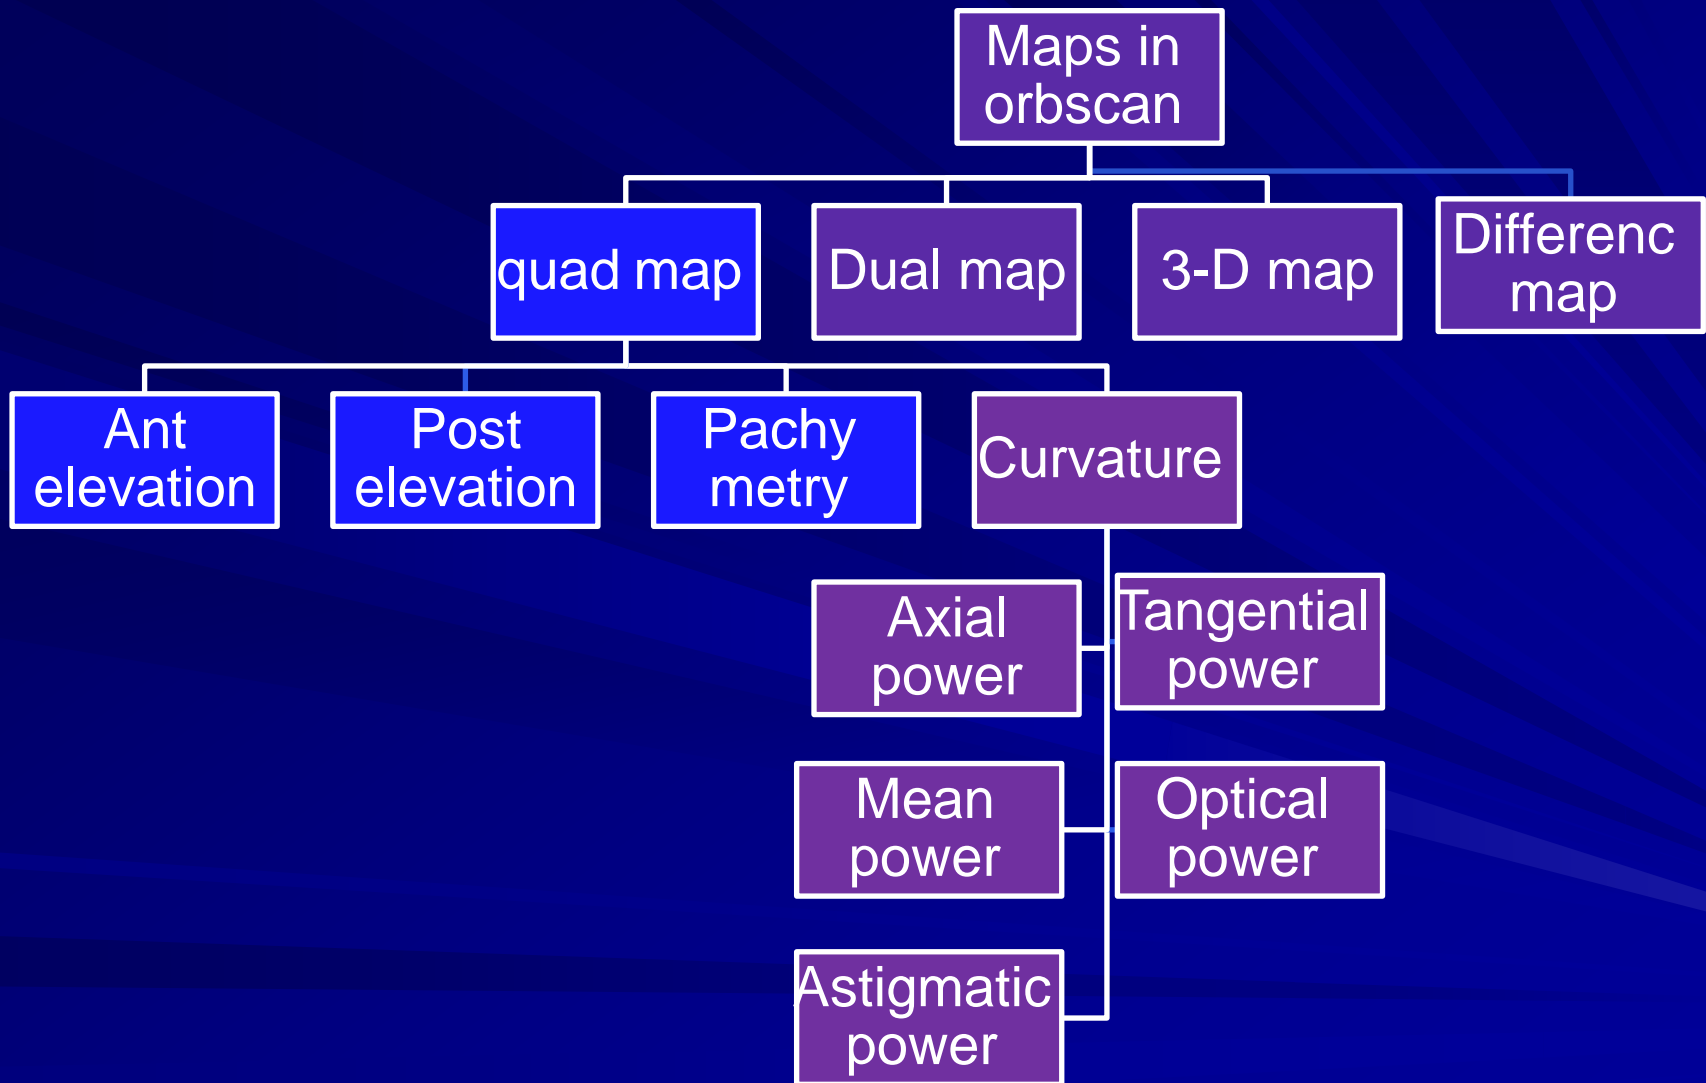

Orbscan IIz

Slit scanning system

Orbscan IIz is able to measure

- AC depth
- Angle kappa
- Pupil diameter
- Sim K
- Pachymetry
- Anterior corneal surface
- Posterior corneal surface

Quad map : show 4 pictures

- Anterior float
- Posterior float
- Keratometric pattern
- Pachymetry

BEST FIT SPHERE

- The computer calculates a hypothetical sphere that matches as close as possible to the actual corneal shape being measured.
- Compares the real surface to the hypothetical sphere showing areas above the surface of the sphere in warm colors and areas below the surface in cool colors

Best fit sphere (BFS)

- BFS-eye surface in mm
- Best fit between eye surface and sphere :
GREEN
- Area under this spherical ideal surface:
BLUE
- Area above this ideal sphere
ORANGE-RED

Elevation Topology: Central Hill

The normal cornea is **Prolate**, meaning that meridional curvature decreases from center to periphery.

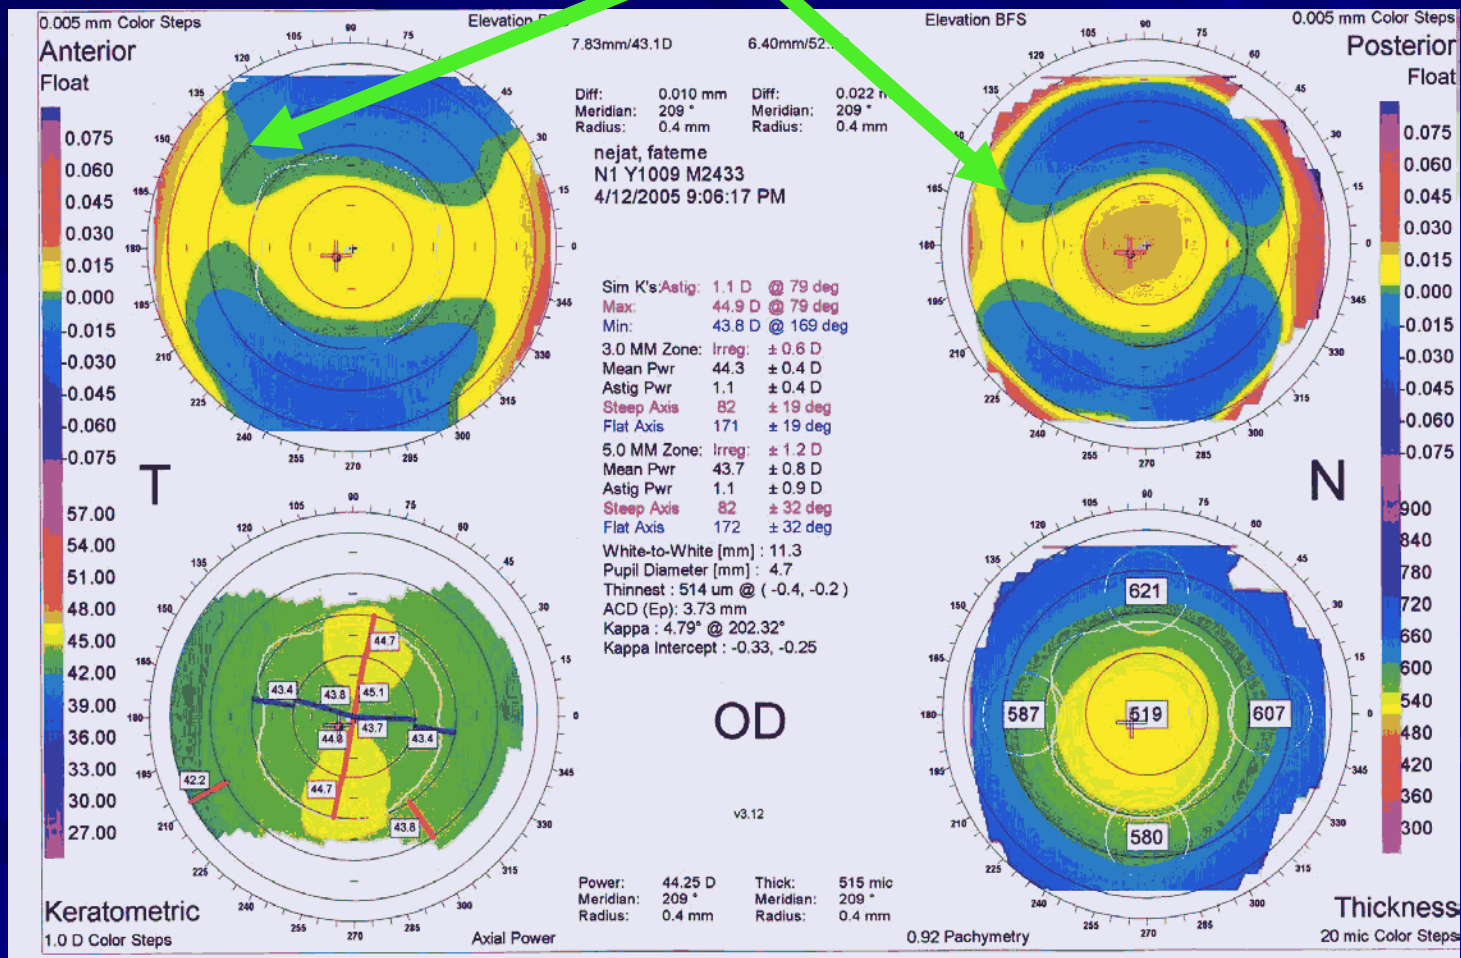

Prolateness of the normal cornea causes it to rise centrally above the reference sphere. The result is a **Central Hill**.

BFS-eye surface in mm

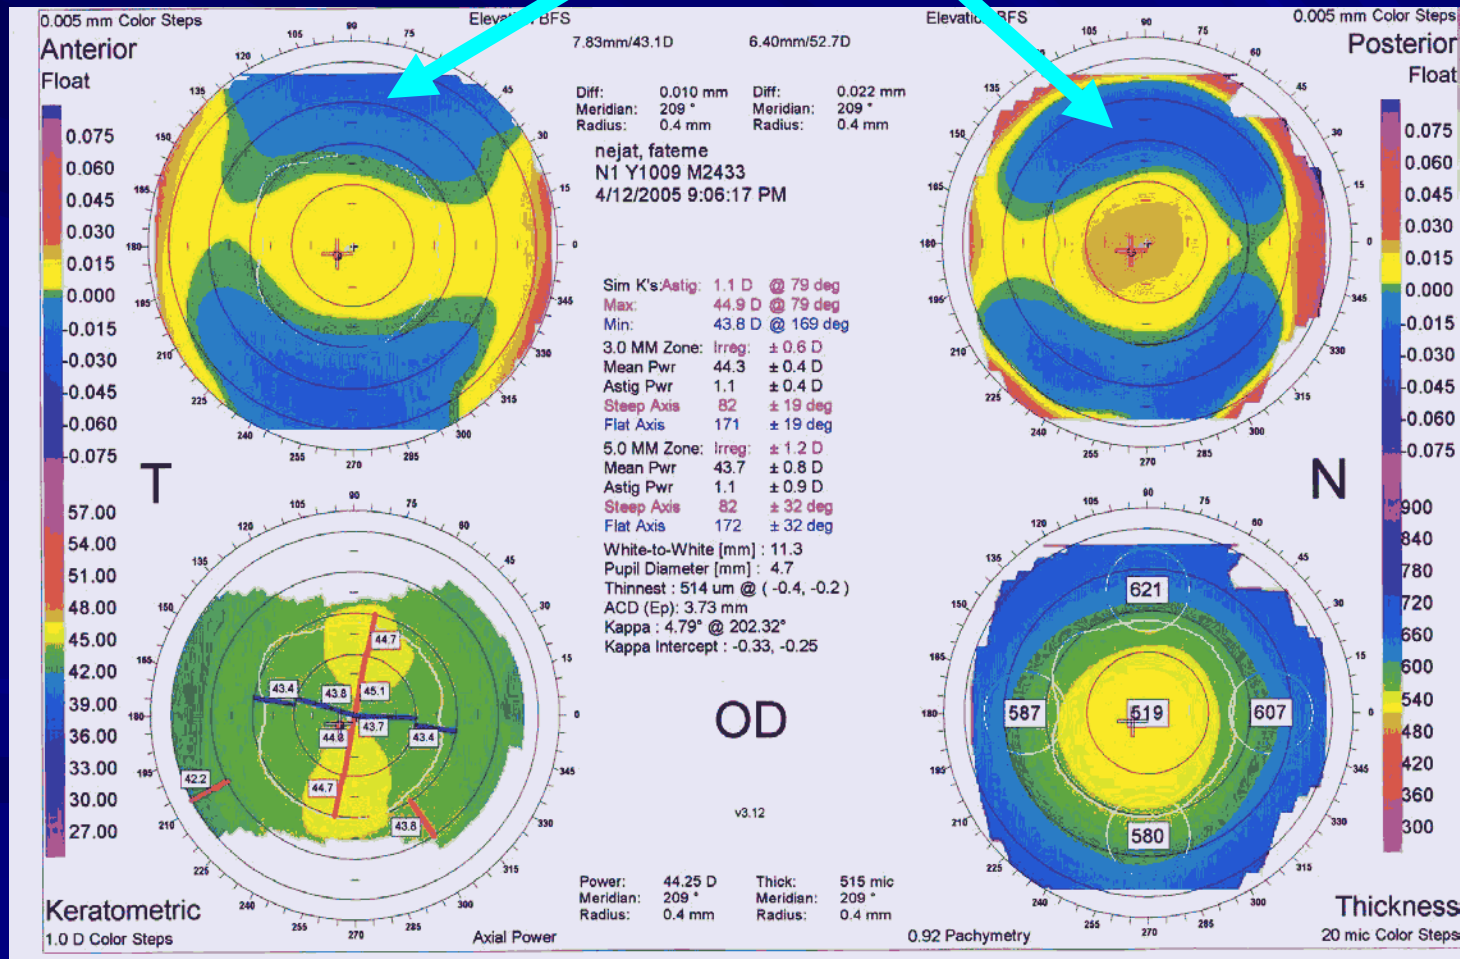

Best fit between eye surface and sphere :

GREEN

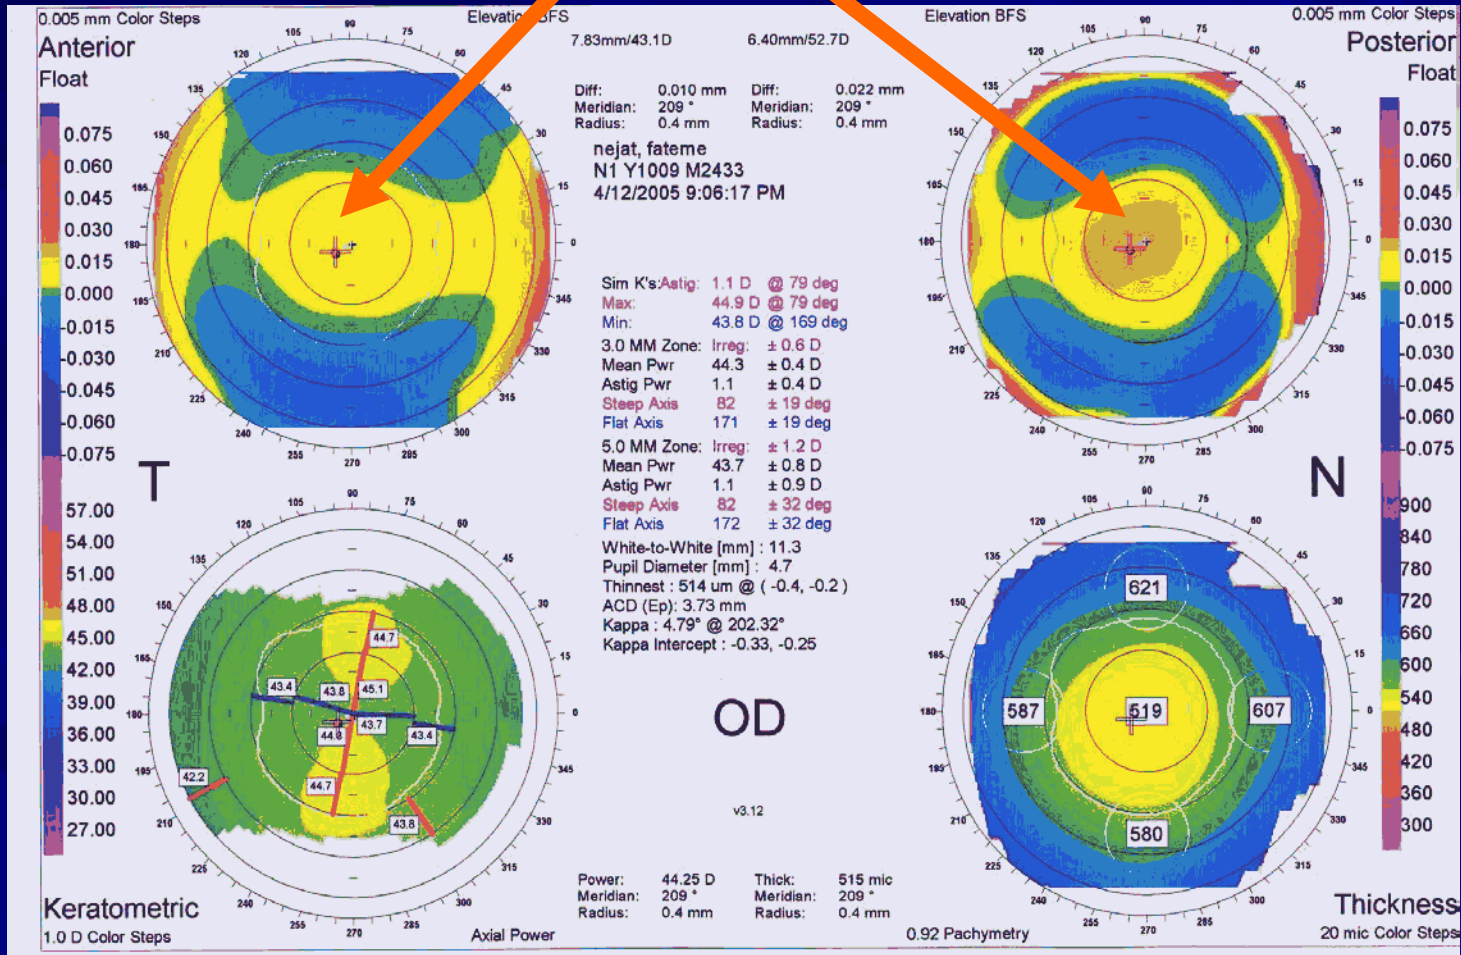

Area under this spherical ideal surface:

BLUE

Area above this ideal sphere

ORASCAN

As all four maps are free of axial artifacts, accurate cone locations can be determined in each. Notice that the four cone locations nearly identical

Forme Fruste K.C

- Average post BFS : 52.53 D (50.2 to 55.3)
- Ratio of radii of Ant to post curvature of cornea ≥ 1.21 and ≤ 1.27
- Average pachymetry difference 7mm to thinnest point 127μ (96 to 206μ) = 100μ

Posterior elevation map

■ Posterior BFS > 55D: **RED FLAG**

■ BUT may be seen in:

- small cornea : WTW < 11mm
- a very steep cornea
- Asian eye
- More prolateness

■ Posterior BFS :53 -55D : **YELLOW FLAG**

Risk Factors for Lasik Candidates :

- Ratio of radii of ant to post curvatures cornea : >1.21 and <1.27
- Post BFS : > 50 D
- Difference thickness (pachymetry 7mm to thinnest pachymetry : $> 90 \mu$)
- Post corneal elevation : $> 50 \mu$

Ratio of radii of Ant to post curvature of cornea
 ≥ 1.21 and ≤ 1.27

Orbscan Risk of Ectasia index:

1. *Number of abnormal maps*

2. *Posterior surface float*

3. *3 mm and 5 mm irregularity*

4. *peripheral thickness changes*

5. *Astigmatism variance between eyes*

6. *Steep k's – mean power map*
