## RGCs & MD CV<sub>HFA</sub>

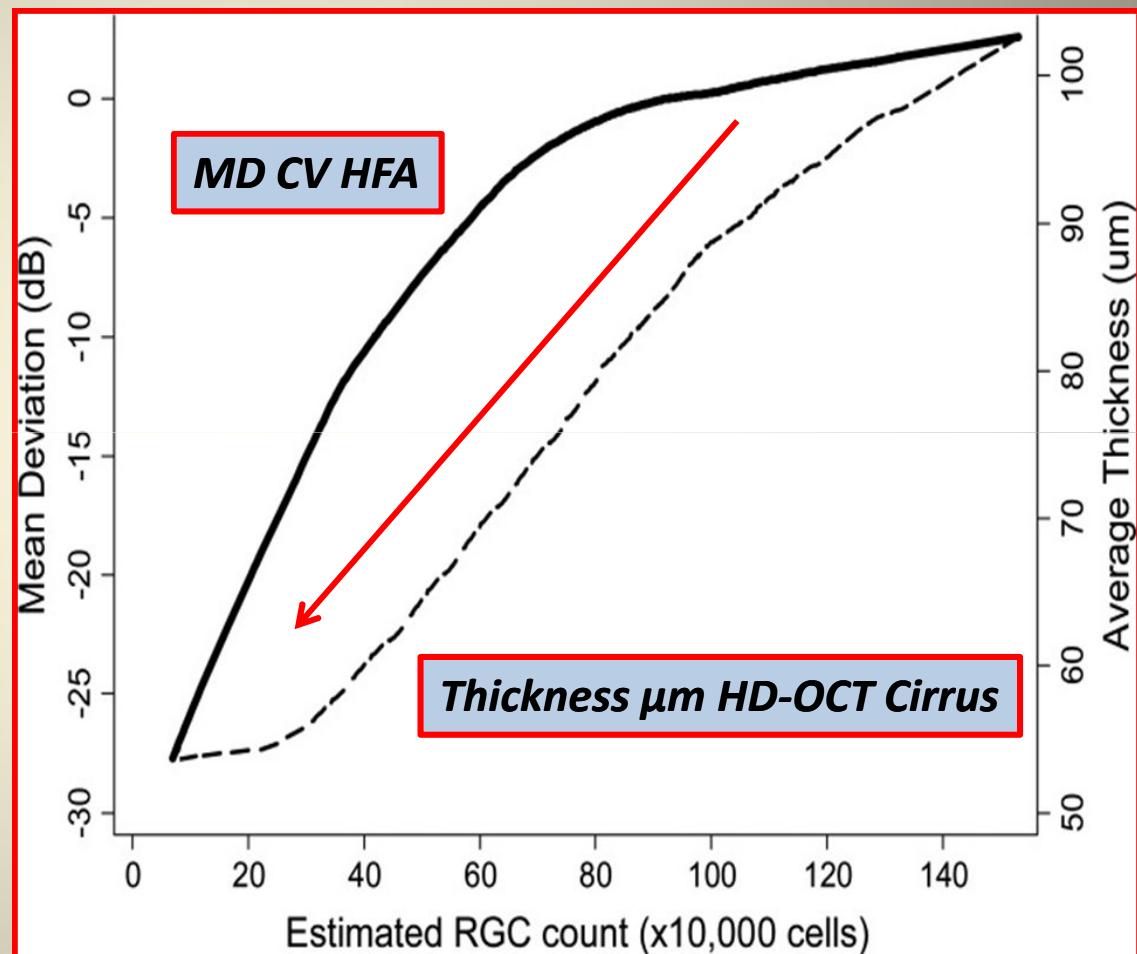

**5000/9000 Retinal Ganglion Cells/Year**

Adapted from Medeiros FA, Lisboa R, Weinreb RN, et al. A combined index of structure and function for staging glaucomatous damage. Arch Ophthalmol. 2012; 130 (5)

- At **early stages** of damage (**high RGC counts**), changes in estimated **RGC** counts correspond to relatively **smaller changes in MD** (continuous line) and relatively **larger changes in average RNFL thickness** (dashed line).

- At **advanced stages** of damage (**low RGC counts**), changes in estimated **RGC** counts correspond to relatively **large changes in MD**, but only **small changes in average RNFL thickness**.

**Estimated RCGs count (x10.000 cells)**  
**RNFL Average Thickness ( $\mu\text{m}$ )**  
**MD Mean Deviation CV (dB)**

Fundus photographs, OCT optic nerve head scans (vertical cut) and Humphrey visual field pattern deviation plots of the left eye obtained the day before trabeculectomy (a) and 1 week postoperatively (b). The red lines on the fundus photographs indicate the location of the OCT scans in the middle panel. *Eye (Lond).* 2006 Jan;20(1):132-4

Preoperative and postoperative optic nerve images of the left eye of a **18-year old** (A, B) and an **81-year old** woman (C, D), where the IOPs were lowered from **25 to 6 mmHg** and from **20 to 7 mmHg**, respectively. The reversal of the backward bowing of the lamina cribrosa is clearly noticeable. Images were taken by enhanced depth imaging SD-OCT. **Dashed lines** indicate the plane of **Bruch's membrane opening BMO**. (**da Weinreb et al. 2012**)

## Glaucoma tra struttura e funzione

di Amedeo Lucente

### Introduzione

E' passato oltre un secolo dalla controversia tra la teoria "reticolarista" di Camillo Golgi (Corteno 1843 – Pavia 1926) e la "dottrina del neurone" di Santiago Ramon y Cajal (Petilla de Aragón 1852 – Madrid 1934), entrambi Premi Nobel per Medicina nel 1906. Le conoscenze sulla conduzione dell'impulso neurale sono notevolmente migliorate nel tempo. Il sistema nervoso ha sempre affascinato studiosi e ricercatori; le cellule ganglionari retiniche non sono state indenni dai lunghi travagli scientifici che hanno caratterizzato la conoscenza del sistema nervoso.

In questo percorso di conoscenza la natura ha spesso costituito un importante campo di confronto, un punto di riferimento formale e funzionale [1]. Struttura e funzione in medicina sono state spesso indagate e messe a confronto pensando a cosa succede in natura; ad alterazioni anatomiche/istologiche dovrebbero corrispondere altrettanti deficit funzionali, ma non sempre è facile trovare le relative correlazioni. Il dualismo struttura/funzione nel glaucoma ha caratterizzato fortemente studi e conoscenze di quest'affezione.

Alterazioni strutturali e funzionali rilevate con strumenti sempre più moderni, non sono spesso in accordo nel follow-up di questa patologia. Danni strutturali più spesso precedono quelli funzionali, come evidenziato da studi e ricerche [2-4]. L'avvento dei nuovi OCT Spectral Domain ha aperto forme alternative d'imaging, approfondite possibilità di studio, modi più efficaci e iconograficamente affascinanti di correlazione tra istologia e funzione. Queste innovative possibilità sono oggi fruibili nei nostri Report grazie al dialogo tra dati tomografici e cluster campimetrici per mezzo di piattaforme informatiche. I risultati raccolti, elaborati e assemblati, sono convogliati in un unico Report Combo. Al momento non tutti gli SD-OCT in commercio permettono questa correlazione, possibile solo tra device compatibili della stessa casa costruttrice. Questo articolo tratterà brevemente delle recenti ricerche scientifiche per quanto riguarda il rapporto struttura/funzione, dei Combo Report, delle novità sugli SD-OCT, campi di

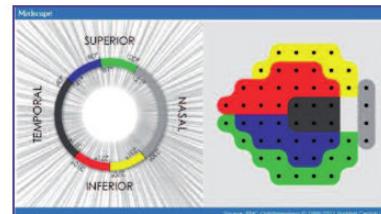

Fig. 1 - Rapporto tra settori RNFL e cluster del campo visivo secondo Garway-Heath.

studio e imaging Hi-tech che stanno aprendo nuove e più approfondite conoscenze sulle cellule ganglionari, sul nervo ottico e sulla lamina cribrosa nel glaucoma.

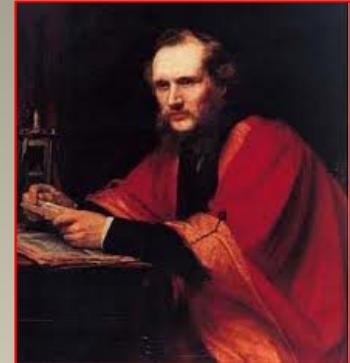

### Stato dell'arte

L'imaging tomografico si è ritagliato un ruolo sempre maggiore nel management del glaucoma. Inizialmente l'interesse strumentale OCT nel glaucoma è stato diretto essenzialmente sulla testa del nervo ottico ONH e lo strato delle fibre nervose peripapillari RNFL. David F. Garway-Heath è tra i maggiori studiosi della relazione struttura/funzione nel glaucoma. A lui si deve la definizione puntuale e goniometrica dei campi settoriali del RNFL nei confronti di singoli cluster del campo visivo[5]. Uno dei suoi primi studi del 1997 "Aging changes of the optic nerve head in relation to open angle glaucoma", termina con alcune considerazioni di fisiologia:

*"Neuroretinal rim area declined at the rate of between 0.28% and 0.39% per year. Vertical optic cup diameter and optic cup area increased with age. The mean cup/disc diameter ratio increased by about 0.1 between the ages of 30 and 70 years".*

Queste informazioni sono preziose e indispensabili per un più obiettivo giudizio dei dati riportati nei Report Glaucoma e per validare meglio i database dei nostri

***Lord William Thomson Kelvin*** (1824-1907)
